Maxmin

姚遠

Maxmin

- Find maximum and minimum in a sequence
- You'll be given a sequence of **15** numbers
 - e.g. 1 : [255, 102, 28, 13, 55, 76, 116 , 33, 195, 47, 206, 93, 27, 133, 109]
 - Maximum: 255
 - Minimum: 13
- Input numbers are eight bits (0~255)

Maxmin.sv

Input Signal	Bit width	Definition
clk	1	10ns clock signal
rst_n	1	Asynchronous negedge reset signal
in_num	8	Random 8-bit input number
in_valid	1	Pulled high during number inputs

Output Signal	Bit width	Definition
out_max	8	maximum
out_min	8	minimum
out_valid	1	Pulled high during output

※ All output signals should be reset to make sure it's not unknown

Output & Waveform

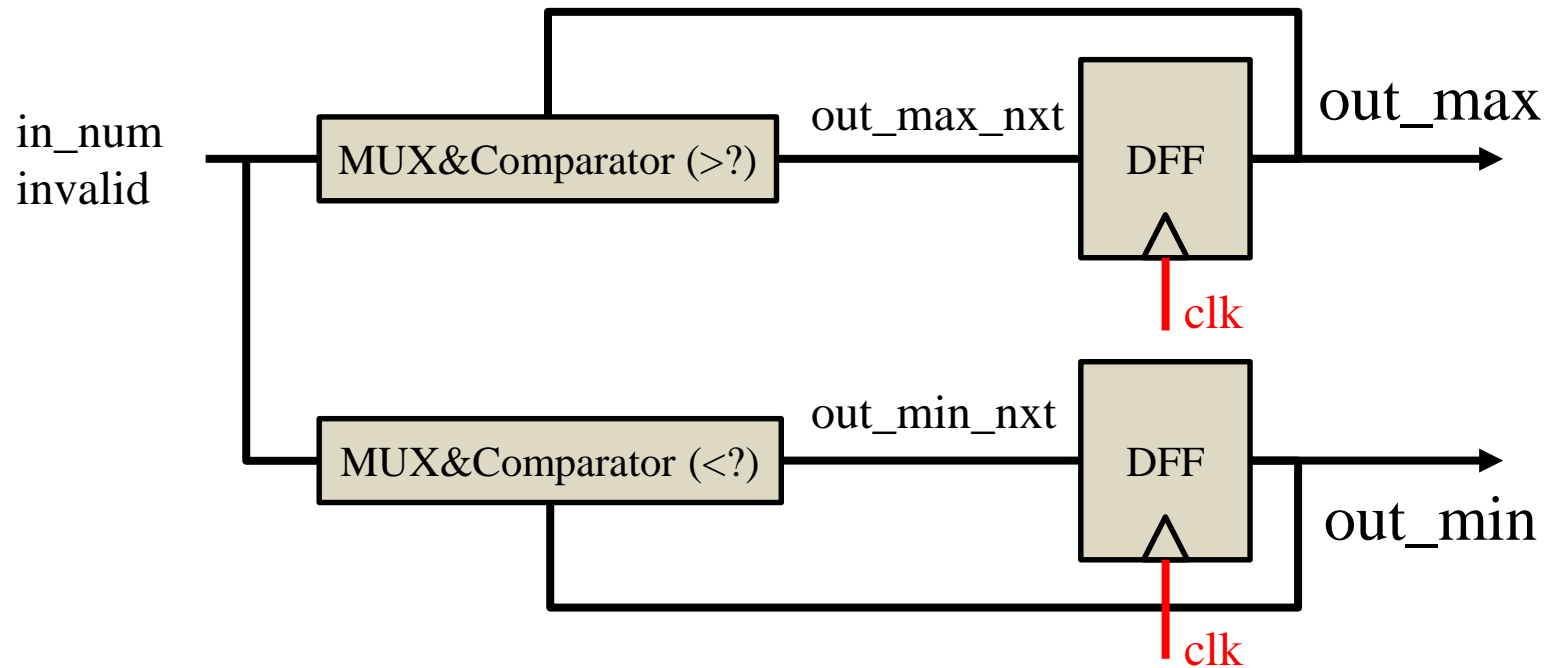

negative trigger asynchronous reset

next input pattern

output maximum and minimum in one cycle

Block diagram for your reference

Just a rough block diagram, some details are omitted, fill them in by yourself

Command

- `tar -xvf ~dcsta01/Lab03.tar`
- 02_SYN
 - No Latch
 - No error
 - No timing violation (MET)
- Separate combinational and sequential blocks
